Nostoc x400

A light micrograph showing several long, wavy, and sometimes coiled filaments of the cyanobacterium Nostoc. The filaments are composed of individual, roughly spherical cells that are closely packed together. The overall color of the filaments is a pale yellowish-green. The background is a uniform, slightly textured yellowish-brown.

Streptococcus termophyllus
Lactobacillus bulgaricus x1000

Fotografía: Geni Álvarez.

A light micrograph showing various bacterial morphologies. There are several long, thin, purple-stained rods scattered across the field of view. There are also numerous small, purple-stained clusters and pairs of spherical bacteria. Two white text boxes with blue arrows point to specific features: one points to a long rod, and the other points to a small cluster of spherical bacteria.
